1800	-2.0	-0,15	14.1	0,95	7	0,5

Note: Watch the case pressures carefully. Rapid compensation at high speeds can cause severe case spikes. If the pump feeds into a blocked center valve that closes quickly, use both case drain ports and direct short case drain lines and a relief valve.

FEATURES

Benefits and features:

For quiet operation and high productivity, specify DENISON'S PV and PVT series pressure compensated, variable volume axial piston pumps. Designed right and built tough, they provide reliable fluid power...even under severe conditions!

You gain more efficient machine operation, upgrade equipment performance and reduce maintenance easily with these quiet, efficient pumps. Because they are interchangeable with other popular pumps, you can use the PV pumps to replace existing older pumps which are not functioning to your satisfaction.

Check these benefits:

- **quiet operation**- improves working conditions, low noise levels over entire operating range.
- **contamination tolerances**- improves dependability and reduces maintenance cost.
- **more power**- because of the PV's high pressure ratings. Max. intermittent operating pressures to 4500 psi (310) bar.
- **system savings**- because higher pressure allows use of smaller components...you can "downsize" and gain real savings.
- **versatility**- full power through drive to allow multiple pumps to be driven from one prime mover.
- **convenience**- side or rear port options for ease and convenience of mounting.
- **high productivity**- because of unique efficiency.
- **greater safety**- you can use fire resistant hydraulic fluids without sacrificing performance.
- **simple construction**- for long, dependable service.
- **tailor the flow**- to your needs with the standard maximum volume adjustment.
- **interchangeable**- with other SAE mounted piston pumps. Conformance to SAE flange mounting and SAE, BSPP or SAE code 61 4-bolt flange.

1 **maximum volume adjustment**

2 **fast compensator response**- 50 ms. off-stroke, 120 ms on-stroke. Other controls available- ventable compensator, load sensing and power limiter

3 **port plate**- replaceable

4 **smoother power and quieter operation**- with nine-piston rotating group

5 **adjustable compensator**

6 **key and spline conform** to industry standard

7 **SAE mounting**- easily interchangeable with other SAE mounted pumps

- **operates with many hydraulic fluids**
- **also available are side porting and rear drive**

DESCRIPTION

GENERAL

The PV/PVT series pumps are variable displacement open circuit piston pumps with a design emphasis on operation economy. These axial piston pumps for open loop operation are suitable for rear drive in the PVT series configuration.

The PV/PVT pumps have a displacement of 0.88 to 7.93 cu. in/rev. (14,4 to 130,0 cc/rev.) with a continuous working pressure up to 4000 psi (280 bar). The pumps can be equipped with a pressure compensator, ventable compensator, load sensing or power limit control.

MOUNTING

The PV/PVT pumps have been designed to operate in a wide range of applications in industries where high pressure and variable flow are required at competitive cost.

These pumps are designed to operate in any position. The mounting hub and two bolt mounting flange are in conformance with SAE standards. The pump shaft must be in alignment with the shaft of the source driver and should be checked with a dial indicator. The mating pilot bore and coupling must be concentric. This concentricity is particularly important if the shaft is rigidly connected to the driven load without a flexible coupling.

REAR DRIVE:

See installation drawings page 11 thru 23 of this bulletin for mounting and page 24 for **maximum allowable torque** in the data section for torque limits.

SHAFT OPTIONS:

SAE splined and keyed, see installation drawings page 11 thru 23 for details.

INPUT SHAFT INFORMATION:

Splined: The shafts will accept a maximum misalignment of 0.002 in. (0,06mm) total indicator reading when the pump is foot mounted and 0.001 in. (0,03 mm) when flange mounted. Angular misalignment at the male and female spline axis must be less than $\pm 0,002$ inch per inch radius ($\pm 0,002$ mm/mm). The coupling interface must be lubricated.

DENISON recommends lithium molydisulfide or similar grease. The female coupling should be hardened to 27/34 Rc and must conform to SAE-J498c, class 5 flat root side fit.

Keyed: High strength heat treated keys must be used. Replacement keys must be hardened to 27-34 Rc. The key corners must be chamfered 0.03 - 0.04 in. (0,75-1,0 mm) at 45° to clear radii that exist in the keyway.

SIDE LOAD CAPABILITY:

The PV series is designed for inline-drive and side loading on the shaft is not recommended. If this is unavoidable consult your nearest DENISON HYDRAULICS representative.

SHAFT BEARING LIFE:

See chart in data section of this bulletin.

See installation drawings in the back of this bulletin for port connections.

PIPING

The maximum case pressure is shown on page 3. Case pressure must never exceed inlet pressure by more than 13 psi (0,9 bar). When connecting case drain line make certain that drain plumbing passes above highest point of the pump before passing to the reservoir.

The case leakage line must be of sufficient size to prevent back pressure in excess of the values on page 3 and returned to the reservoir below the surface of the oil as far from the supply suction as possible. All fluid lines, whether pipe, tubing, or hose must be adequate size and strength to assure free flow through the pump. An undersize inlet line will prevent the pump from operating at full rated speed. An undersize outlet line will create back pressure and cause heat generation. Flexible hose lines are recommended. If rigid piping is used, the workmanship must be accurate to eliminate strain on the pump port block or to the fluid connections. Sharp bends in the lines must be eliminated wherever possible. All system piping must be cleaned with solvent or equivalent before installing pump. Make sure the entire hydraulic system is free of dirt, lint, scale, or other foreign material.

Caution: Do not use galvanized pipe. Galvanized coating can flake off with continued use.

DESCRIPTION

SERVICE INFORMATION

These hydraulic products are designed to give long dependable service when properly applied and their systems properly maintained. These general instructions apply to typical systems. Specific instructions for particular equipment can be developed from them.

Refer to bulletin S1-AM009 for service information.

RECOMMENDED FLUIDS

The fluid recommended for use in these pumps has a petroleum base and contains agents which provide oxidation inhibition and anti-rust, anti-foam and de-aerating properties as described in DENISON HYDRAULICS standard HF-1. Where anti-wear additive fluids are specified, see DENISON HYDRAULICS standard HF-0.

VISCOSITY

max. at cold start- 7500 SUS (1600 cSt)
at low pressure, low flow, and if possible, low speed
max. at full power- 750 SUS (160 cSt)
optimum for max. life- 140 SUS (30 cSt)
minimum at full power- 60 SUS (10 cSt)

VISCOSITY INDEX

90 V. I. minimum. Higher values extend the range of operating temperature but may reduce the service life of the fluid.

TEMPERATURE

Determined by the viscosity characteristics of the fluid used. Because high temperatures degrade seals, reduce the service life of the fluid and create hazards, fluid temperature should not exceed 180°F (82°C) at the case drain.

MAINTENANCE

The pump is self-lubricating and preventative maintenance is limited to keeping system fluid clean by changing filters frequently. Keep all fittings and screws tight. Do not operate at pressures and speeds in excess of the recommended limit. If the pump does not operate properly, check the troubleshooting chart before attempting to overhaul the unit. Overhauling may be accomplished by referring to the disassembly, rework limits of wear parts, and assembly procedures. Refer to the service manual for troubleshooting and overhaul information.

FLUID CLEANLINESS

Fluid must be cleaned before and continuously during operation by filters that maintain a cleanliness level of ISO 17/14. This approximately corresponds to NAS 1638 class 8 (class 9 for 15 micron and smaller). This fluid level cleanliness can usually be accomplished by the effective use of 10 micron filters. Better cleanliness levels will significantly extend the life of the components. As contaminant generation may vary with each application, each must be analyzed to determine proper filtration to maintain the required cleanliness level.

DESCRIPTION

SYSTEM RELIEF VALVES

Although the PV/PVT series pumps have very fast off-stroke compensator response, system relief valves are recommended in all cases for safety considerations.

COMPENSATOR

The C and F pressure compensator control allows the pump to deliver full volume from the outlet port until the pressure rises to the value set by the control. One turn clockwise of the pressure compensator adjusting screw represents a pressure increase of approximately 650 psi (45 bar).

The control then reduces the pump volume to that required by the system while maintaining the preset pressure at the outlet port. The stroking piston is controlled by a 3-way valve which is shifted by discharge pressure.

The fast response (typically 50 ms off-stroke and 120 ms on-stroke) and high flow capacity of this valve holds pressure overshoot and undershoot to a minimum.

An adjusting screw complete with locknut allows the pump volume to be set between maximum and zero.

Clockwise rotation pumps have the pressure compensator control located on the left side of the pump body; on counter clockwise rotation pumps the control is on the right side.

Units with C- compensator, a 30-50 psi (2-3 bar) check valve is recommended in the discharge port on all open loop pumps. The check valve must be located approximately 12 in. (0.3 M) from the discharge port. Failure to locate the check valve at this point may result in compensator hunting.

C- COMPENSATOR CIRCUIT

A – Inlet
B – Outlet
D – Case drain

F- VENTABLE COMPENSATOR

The F- compensator is used in applications requiring remote control pressure. The remote relief is connected to the vent port. The pressure may be controlled at any level below the compensator pressure setting. The vent port may also be used to remotely vent-off the compensator for starting.

Caution: The F- and L- differential spring is the same as the C- compensator spring. Therefore it is possible to set the differential pressure too high.

A – Inlet
B – Outlet
D – Case drain
V – Vent

DESCRIPTION

L- LOAD SENSING COMPENSATOR

The L- compensator is used for load sensing circuits. The L- compensator prevents pilot flow from entering the circuit which will eliminate creeping of the load. The L- compensator will let the pump deliver a constant flow rate to the circuit by providing an adjustable ΔP across the customers orifice or valve. The pump will operate at 250-400 psi (17-28 bar) above load pressure.

A – Inlet
B – Outlet
D – Case drain
V – Vent

J- TORQUE LIMITER (low range) K- TORQUE LIMITER (high range)

The torque limiter monitors both pressure and displacement (hanger angle). It is a single spring unit which works with the "F" compensator, and can also be connected into a load sensing or remote venting circuit. As pressure rises, flow is reduced according to the zero adjustment and spring rate of the torque limiter. When pressure has risen to its full value, control is assumed by the "F" compensator. The torque limiter functions down to 20% of corner power. Lower adjustment are possible, at the expense of peak pressure.

A – Inlet
B – Outlet
D – Case drain
V – Vent

MEASUREMENTS OF PUMP ACOUSTICAL DATA WERE MADE IN ACCORDANCE WITH ANSI B93.71M-1986, HYDRAULIC FLUID POWER-PUMPS-TEST CODE FOR THE DETERMINATION OF AIRBORNE NOISE LEVELS, (TECHNICALLY SIMILAR TO ISO 4412-1)

THE MEASUREMENTS WERE MADE IN A SPECIAL REVERBERANT TEST ROOM IN THE DENISON HYDRAULICS MARYSVILLE FACILITY WHICH WAS QUALIFIED TO ANSI S12.23-1990, (REVISION OF ANSI S1.33-1982), ENGINEERING METHODS FOR THE DETERMINATION OF SOUND POWER LEVELS OF NOISE SOURCES IN A SPECIAL REVERBERATION TEST ROOM.

<i>Fluid motor power</i>	<i>hp</i>	$\frac{\text{rpm} \times (\text{in}^3/\text{rev}) \times (\text{psi}) \times \text{overall eff.}}{395934}$
(metric)		
<i>Pump input torque</i>	<i>Nm</i>	$\frac{\text{pressure}(\text{bar}) \times \text{displacement} (\text{cm}^3/\text{rev})}{20\pi \times \text{mech. eff.}}$
<i>Pump input power</i>	<i>kW</i>	$\frac{\text{rpm} \times (\text{cm}^3/\text{rev}) \times (\text{bar})}{600000 \times \text{overall eff.}}$
<i>Pump output flow</i>	<i>Lpm</i>	$\frac{\text{rpm} \times (\text{cm}^3/\text{rev}) \times \text{volumetric eff.}}{1000}$
<i>Fluid motor speed</i>	<i>rpm(min⁻¹) (tr/mn)</i>	$\frac{1000 \times \text{flow rate} (\text{Lpm}) \times \text{volumetric eff.}}{\text{displacement} (\text{cm}^3/\text{rev})}$
<i>Fluid motor torque</i>	<i>Nm</i>	$\frac{\text{pressure}(\text{bar}) \times \text{displacement} (\text{cm}^3/\text{rev}) \times \text{mech. eff.}}{20\pi}$
<i>Fluid motor power</i>	<i>kW</i>	$\frac{\text{rpm} \times (\text{cm}^3/\text{rev}) \times (\text{bar}) \times \text{overall eff.}}{600000}$

"The product information specifications and descriptions contained in this catalog have been compiled for the use and convenience of our customers from information furnished by the manufacturer, and we cannot and do not accept any responsibility for the accuracy or correctness of any description, calculation, specification or information contained herein. No such description, calculated, specified or information regarding the products being sold has been made part of the basis of the bargain nor has same created or amounted to an express warranty that the products would conform thereto. **We are selling the goods and merchandise illustrated and described in this catalog on an as is basis and disclaim any implied warranty, including any warranty of merchantability or warranty of fitness for any particular purposes whatsoever, with respect to the goods and merchandise sold.** All manufacturer warranties shall be passed on to our customers, but we shall not be responsible for special, indirect, incidental or consequential damages resulting from the use of any of the products or information contained or described in the catalog."
